Prior Authorization AI Competitive Landscape & MarginLogic Positioning

Document ID: PMS-EXP-PACL-001 **Version:** 1.0 **Date:** 2026-03-09 **Author:** Ammar (CEO, MPS Inc.) **Status:** Draft

---

1. Executive Summary

The prior authorization (PA) AI market is consolidating around four platform archetypes — ambient-to-PA (Abridge), hyperscaler platform (Amazon), EHR-native (Epic), and partner-marketplace (Dragon Copilot) — each approaching PA from a different entry point. None of them solve the specialty practice's core problem: **predicting PA outcomes before submission with specialty-specific explainability**.

MarginLogic must own the **specialty-specific, explainable PA prediction** niche — the only segment where a focused PMS can outperform generalist platforms. This document maps the competitive landscape, identifies white space, and defines MarginLogic's defensible wedge.

Market Context

- **$98B** in annual administrative services in front-office RCM; PA automation software is only 3% of that, growing 10x YoY
- **CMS-0057-F** took effect January 1, 2026 (72-hour expedited / 7-day standard response mandates); FHIR PA APIs required by January 2027
- **82%** of hospital executives plan to expand AI investments in PA automation (Bain 2025)
- **99%** of clinicians trust AI for PA approvals (Cohere Health 2026 survey)
- Specialty denial rates rising: orthopedic ASC 14–22%, oncology highest PA burden (88% of clinicians affected)

---

2. Competitive Landscape Map

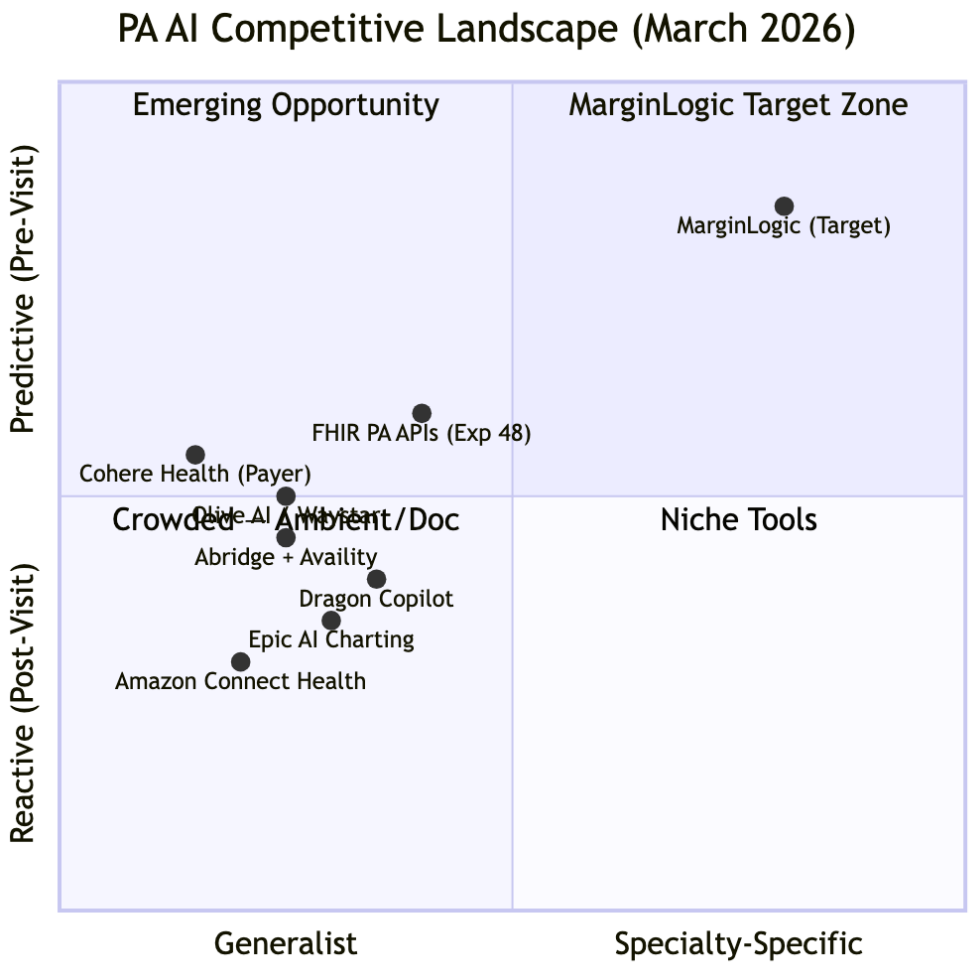

Diagram 0

---

3. Competitor Deep Dives

3.1 Abridge — Ambient-to-PA Pipeline

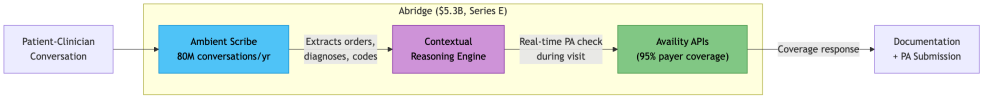

Diagram 1

Dimension	Detail
Valuation	$5.3B (Series E, June 2025 — doubled in 4 months)
Investors	a16z, Khosla Ventures
Scale	200+ health systems; projected 80M patient conversations in 2026
PA Strategy	Real-time PA at point of conversation via Availity partnership (announced JPM26, Jan 2026)
Mechanism	Ambient AI extracts clinical context → maps to orders → fires PA check via Availity's FHIR-native APIs → returns coverage decision during the visit
Payer Reach	Availity connects to 95% of payers, 3.4M+ providers
EHR Integration	Deep Epic integration; also supports MEDITECH, Oracle Health
Pricing	Enterprise per-provider licensing; not publicly disclosed

Strengths: - Compresses weeks-long PA process to real-time during the visit - Ambient data capture means PA documentation is pre-populated from conversation - Availity partnership gives near-universal payer connectivity - Massive data flywheel (80M conversations) for model improvement

Weaknesses for specialty practices: - **Generalist model** — same PA logic for dermatology, orthopedics, oncology, and retina - **No outcome prediction** — checks if PA is *required*, not whether it will be *approved* - **No specialty-specific clinical criteria mapping** — doesn't know that anti-VEGF PA for wet AMD requires OCT showing subretinal fluid ≥ 300µm - **Enterprise pricing** excludes small-to-mid specialty practices (5–50 providers) - **Epic-centric** — limited value for practices on non-Epic EHRs

MarginLogic differentiation: Abridge tells you PA is required. MarginLogic tells you the PA will be *denied* unless you add OCT evidence showing subretinal fluid thickness — and auto-attaches it.

3.2 Amazon Connect Health — Hyperscaler Platform Play

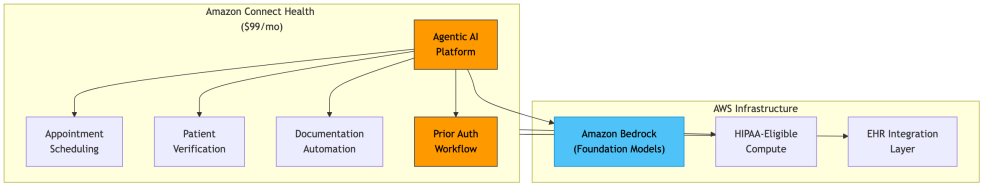

Diagram 2

Dimension	Detail
Launch	March 5, 2026 (HIMSS 2026)
Pricing	**$99/month per user** for up to 600 encounters/month
Architecture	Agentic AI platform on AWS; uses Amazon Bedrock foundation models
PA Strategy	PA as one of many administrative automation workflows; conditional scheduling based on PA approval status
HIPAA	HIPAA-eligible; runs on AWS infrastructure
Early Results	UC San Diego Health: 630 hours/week saved, 60% call abandonment reduction

Strengths: - **Price disruption** — $99/mo is an order of magnitude cheaper than enterprise solutions - AWS infrastructure scale and reliability - Platform approach: PA is one module alongside scheduling, verification, documentation - Agentic AI can chain multi-step PA workflows (check requirements → gather docs → submit → follow up) - Bedrock gives access to multiple foundation models (Claude, Llama, Titan)

Weaknesses for specialty practices: - **Breadth over depth** — PA is one feature among many; not purpose-built for PA optimization - **No clinical intelligence** — can check if PA is required but cannot evaluate clinical criteria - **No specialty context** — same $99 platform for family medicine and retina surgery - **No prediction** — no approval/denial probability; no suggested documentation improvements - **Early stage** — just launched March 2026; limited healthcare-specific training data - **Cloud-only** — all data processed on AWS; no on-premise option for PHI-sensitive practices

MarginLogic differentiation: Amazon sells a $99 admin automation platform. MarginLogic sells a specialty-specific PA intelligence engine that increases approval rates by predicting denials before submission.

3.3 Microsoft Dragon Copilot — Partner Marketplace Strategy

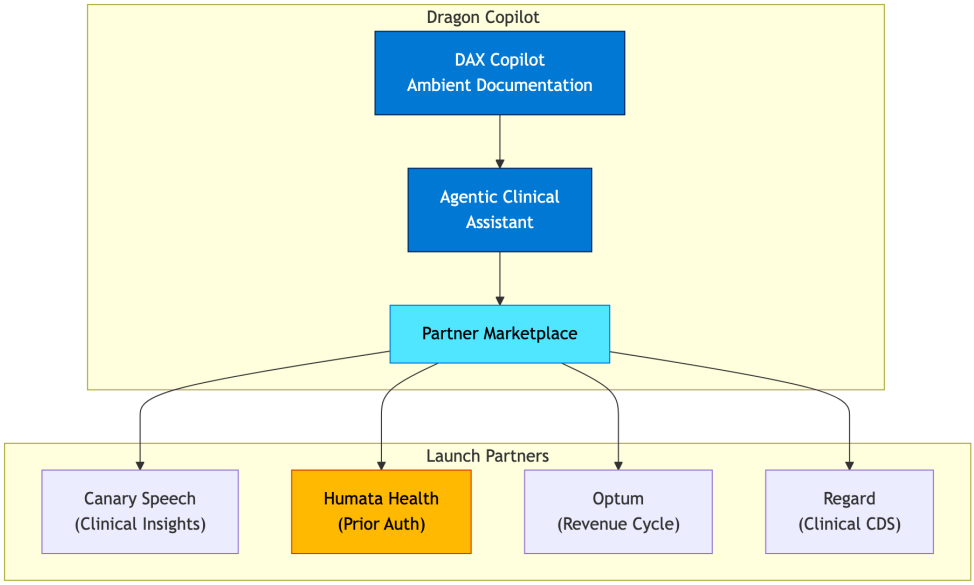

Diagram 3

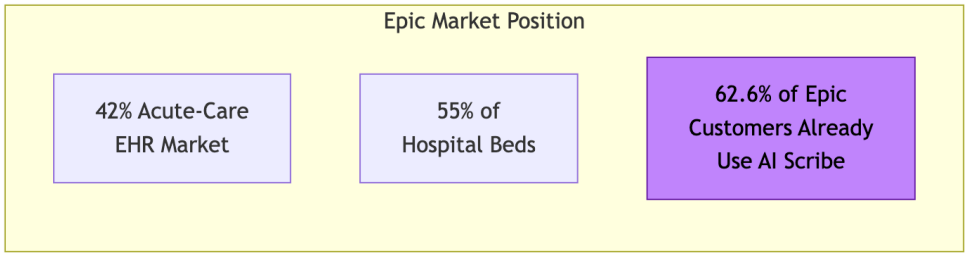
Dimension	Detail
Announced	HIMSS 2026 (March 5, 2026)
Strategy	Dragon Copilot as the “clinical operating system”; partner-built apps for PA, RCM, CDS
PA Approach	Delegates PA to partners (Humata Health, Optum) via marketplace integrations
Key Upgrade	Evolved from documentation tool → agentic clinical assistant with persona-specific capabilities (nurses, radiologists)
Distribution	Microsoft Azure Marketplace; direct integration into Dragon Copilot workflow
Rural Push	Explicit rural hospital outreach announced at HIMSS 2026

Strengths: - Microsoft/Nuance brand trust and existing installed base - Partner ecosystem means specialized PA tools (Humata Health) plug in without Microsoft building them - Ambient documentation generates the clinical context needed for PA - Agentic capabilities: referral letters, after-visit summaries, PA documentation auto-generated - Azure cloud scale; HIPAA BAA via Microsoft

Weaknesses for specialty practices: - **PA is outsourced to partners** — Dragon itself doesn’t do PA intelligence, it passes to Humata/Optum - **Partner fragmentation** — different partners for different PA use cases; no unified specialty PA workflow - **Enterprise pricing** — DAX Copilot pricing through Azure Marketplace; not designed for small practices - **No prediction layer** — partners handle PA submission, not outcome prediction - **Marketplace immaturity** — just launched; partner integrations are early-stage

MarginLogic differentiation: Dragon is a platform that hosts PA tools built by others. MarginLogic *is* the PA tool — purpose-built for specialty practices with predictive intelligence that no Dragon marketplace partner offers.

3.4 Epic AI Charting — The EHR-Native Incumbent



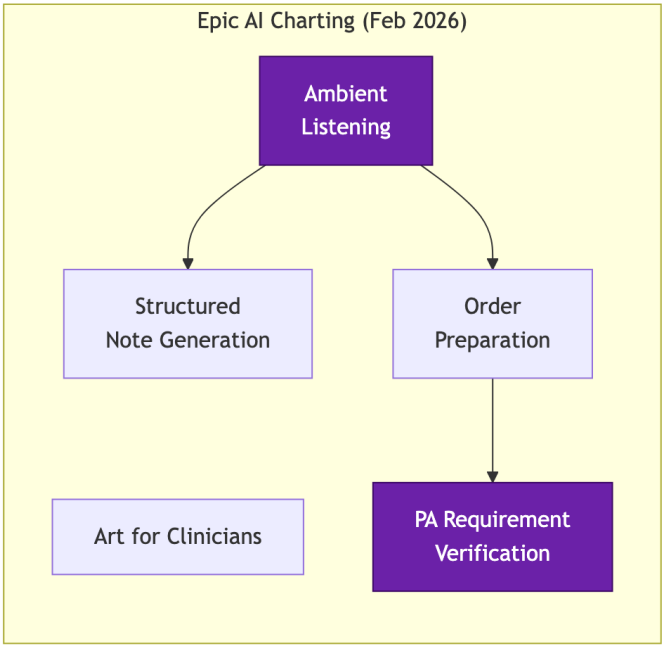


Diagram 4

Dimension	Detail
Launch	February 4, 2026
Market Position	42% acute-care EHR market, 55% of hospital beds
Adoption	62.6% of Epic customers already using an AI scribe (as of June 2025); Epic AI Charting is native
PA Capability	Art for Clinicians generates pre-visit summaries and verifies PA requirements in real-time
Architecture	Native to Epic; no separate login, contract, or integration needed
Pricing	Bundled with Epic license (included for existing customers)

Strengths: - **Zero integration cost** — native to Epic; already in the clinician's workflow - **Bundled pricing** — existential threat to every ambient scribe startup that charges per-provider - Pre-visit summaries contextualize PA requirements before the encounter - Structured note generation maps directly to PA documentation needs - Massive installed base and clinician trust

Weaknesses for specialty practices: - **Epic-only** — useless for the ~58% of healthcare not on Epic; most specialty practices use specialty-specific EHRs (Nextech, Modernizing Medicine, AdvancedMD) - **PA verification, not PA intelligence** — tells you PA is required, not whether it will be approved - **Generalist** — same AI for cardiology, retina, orthopedics; no specialty-specific clinical criteria - **No denial prediction** — no probability scoring; no suggested documentation improvements - **No payer-specific intelligence** — doesn't learn that UHC denies anti-VEGF after 12 injections without re-authorization while Aetna requires it after 8

MarginLogic differentiation: Epic solves PA for Epic hospitals. MarginLogic solves PA for specialty practices on *any* EHR — with predictive intelligence that Epic doesn't attempt.

3.5 Cohere Health — Payer-Side PA Platform

Dimension	Detail
Position	Payer-side PA platform (not provider-facing)
Scale	660K+ providers, 12M+ PA requests/year processed
Auto-Approval	Up to 90% of PA requests auto-approved for participating plans
Approach	AI evaluates clinical evidence against payer criteria on the payer side
Funding	$36M+ raised
Relevance	Shapes what payers expect; MarginLogic must understand Cohere's criteria to optimize submissions

---

4. Competitive Comparison Matrix

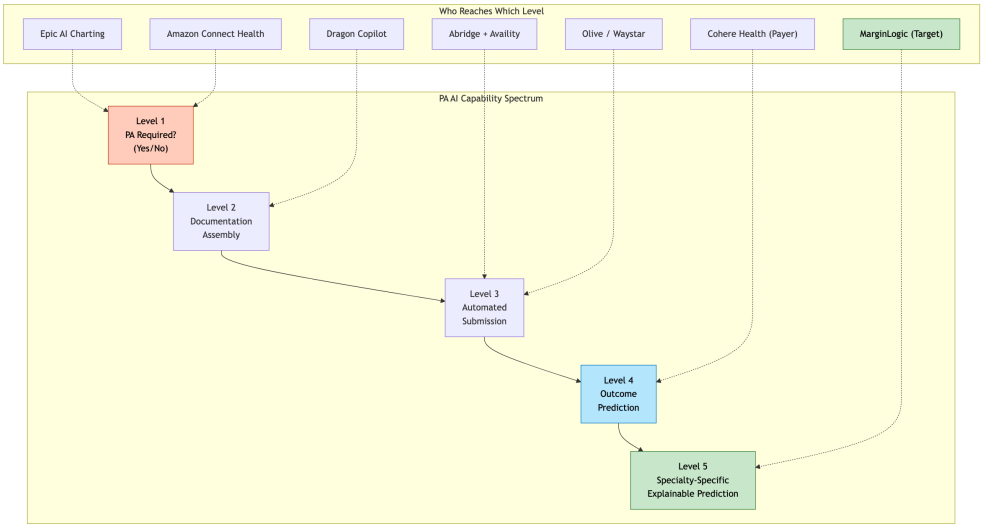

Diagram 5

Capability	Epic AI Charting	Abridge	Amazon Connect	Dragon Copilot	Cohere (Payer)	MarginLogic
PA requirement detection	Yes	Yes	Basic	Via partners	N/A (payer)	**Yes**
Clinical documentation assembly	Yes	Yes	No	Via partners	N/A	**Yes**
Multi-payer submission	No (Epic only)	Yes (Availity)	No	Via partners	N/A	**Yes (Exp 47–48)**
Real-time during visit	Yes	Yes	No	No	N/A	**Yes**
Approval/denial prediction	**No**	**No**	**No**	**No**	Yes (payer-side)	**Yes**
Specialty-specific criteria	**No**	**No**	**No**	**No**	Partial	**Yes**
Explainable reasoning	**No**	**No**	**No**	**No**	**No**	**Yes**
Payer-specific pattern learning	**No**	**No**	**No**	**No**	Yes (own data)	**Yes**
Denial prevention suggestions	**No**	**No**	**No**	**No**	**No**	**Yes**
Works on non-Epic EHR	No	Partial	Yes	Partial	N/A	**Yes**
Small practice pricing	No	No	Yes ($99)	No	N/A	**Yes**

5. White Space Analysis — MarginLogic's Defensible Wedge

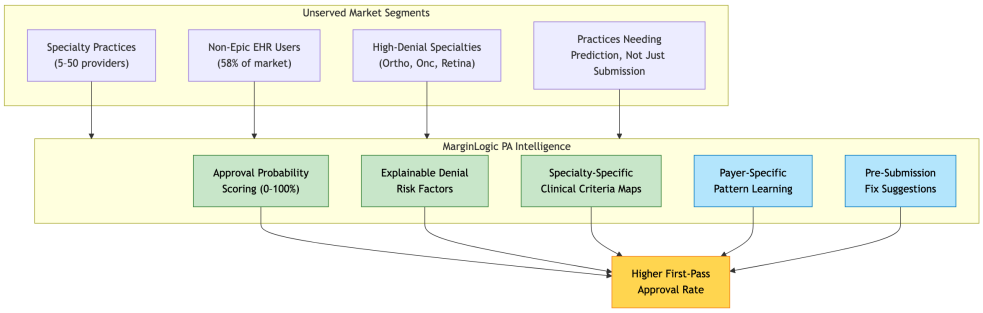

Diagram 6

5.1 The Niche Nobody Owns

Every competitor stops at **Level 3** (automated submission). No one on the provider side offers **Level 4–5** (outcome prediction with specialty-specific explainability). This is MarginLogic's wedge:

What MarginLogic Does	What It Replaces	Why Competitors Can't/Don't
Predicts PA approval probability before submission	Staff guessing + submitting blind	Requires specialty-specific training data and clinical criteria mapping — generalist platforms can't justify the specialization
Explains *why* a PA will be denied (missing OCT, insufficient trial period, wrong CPT modifier)	Staff discovering denials 7–14 days post-submission	Requires deep specialty workflow understanding; Abridge/Epic optimize for the 80% (primary care), not the 20% (specialty)
Suggests documentation fixes to increase approval probability	Reactive appeal process after denial	Requires mapping payer-specific criteria to clinical documentation — no competitor has built this feedback loop
Learns payer-specific approval patterns per specialty per procedure	Static payer policy PDFs (Exp 44)	Requires historical PA outcome data correlated with clinical variables — MarginLogic's CMS dataset (Exp 43) and payer API integrations (Exp 45–47) create this data asset
Runs on any EHR via FHIR APIs (Exp 16, 48)	Epic-only solutions (Epic AI Charting)	Competitors are locked into their platform; MarginLogic is EHR-agnostic by design

5.2 Specialty-Specific Explainability — The Core Differentiator

Generic PA tools treat all specialties the same. MarginLogic must encode **specialty-specific clinical criteria** that drive PA decisions:

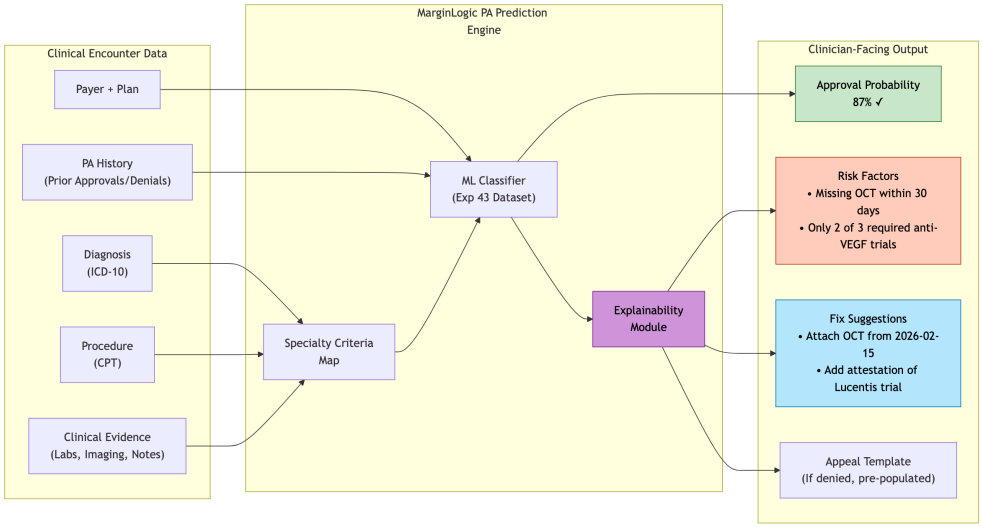

Diagram 7

Example — Retina (Anti-VEGF for Wet AMD):

PA Criterion (UHC)	What MarginLogic Checks	Explainable Output
Diagnosis of wet AMD confirmed by fluorescein angiography or OCT	OCT date within 90 days in patient record	“OCT found: 2026-01-20 (48 days ago) — meets UHC 90-day requirement”
Failure or contraindication to first-line agent (e.g., Avastin)	Treatment history in medication records	“WARNING: Only 1 Avastin injection documented. UHC requires 3-injection trial before Eylea step-up. Approval probability: 34%”
Re-authorization after 12 injections	Count of prior approved injections	“Injection count: 11. Re-auth will be required after next injection. Pre-submitting re-auth now.”
Supporting documentation attached	OCT images, visual acuity, clinical notes	“Missing: Visual acuity from last visit. Add to increase approval probability from 72% to 91%.”

Example — Orthopedics (Knee MRI):

PA Criterion (BCBS TX)	What MarginLogic Checks	Explainable Output
6 weeks of conservative therapy documented	Physical therapy notes, NSAID prescriptions	“PT notes found: 4 visits over 3 weeks. BCBS requires 6 weeks. Approval probability: 28%”
X-ray completed before MRI	Imaging orders in record	“Knee X-ray: 2026-02-01 — meets BCBS imaging-first requirement”
Clinical indication matches approved list	ICD-10 code mapping	“M23.21 (derangement of meniscus) — approved indication for MRI. +”

5.3 Why This Niche Is Defensible

1. **Data moat**: MarginLogic's CMS PA dataset (Exp 43) + real PA outcomes from PMS practices create a growing labeled dataset no competitor has
2. **Specialty depth**: Each specialty's PA criteria require clinical domain expertise to encode — generalist platforms won't invest in this for <20% of their revenue
3. **Network effects**: Every PA outcome (approval/denial + clinical variables) improves the prediction model. More specialty practices → more data → better predictions → more practices
4. **Regulatory tailwind**: CMS-0057-F mandates payers publish approval/denial metrics starting 2026 — this data feeds directly into MarginLogic's payer pattern learning
5. **FHIR-native**: Experiments 16 and 48 give MarginLogic direct payer API access as they come online in 2027, bypassing clearinghouse intermediaries
6. **EHR-agnostic**: Unlike Epic (locked in) and Abridge (Epic-focused), MarginLogic works on specialty EHRs (Nextech, ModMed, AdvancedMD) that serve the target market

---

6. Threat Assessment

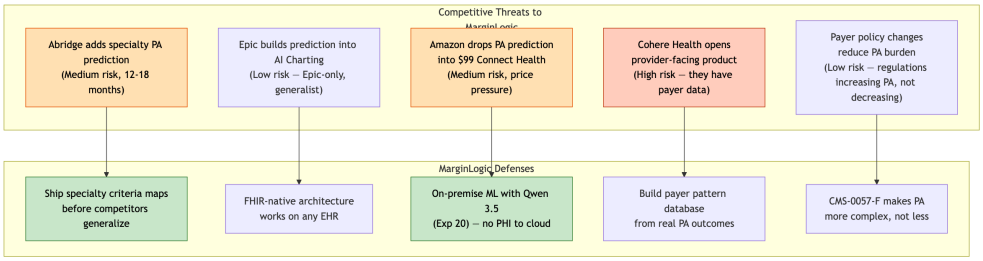

Diagram 8

Threat	Risk Level	Timeline	Mitigation
Abridge adds specialty PA prediction	Medium	12–18 months	Ship first; Abridge optimizes for primary care volume, not specialty depth
Epic builds PA prediction into AI Charting	Low	18–24 months	Epic serves hospitals, not specialty practices; Epic-only limitation
Amazon price-dumps PA features	Medium	6–12 months	Compete on *intelligence*, not price; Amazon's $99 can't include specialty clinical mapping
Cohere opens provider-facing product	High	12 months	Cohere has payer data but not provider workflow integration; MarginLogic has both via PMS
Payer policy changes reduce PA burden	Low	Ongoing	CMS-0057-F increases regulatory complexity; specialty PA volume growing, not shrinking
Dragon Copilot partner builds specialty PA	Medium	12 months	MarginLogic can *also* be a Dragon marketplace partner — offense, not just defense

---

7. MarginLogic Implementation Roadmap

Phase 1: Foundation (Aligns with Experiments 43–48)

Component	Experiment	Status	MarginLogic Role
CMS PA training dataset	Exp 43	Draft	ML training data for PA classifier
Payer policy download	Exp 44	Draft	Payer-specific criteria extraction
CMS Coverage API	Exp 45	Draft	Medicare PA requirement lookup
UHC API Marketplace	Exp 46	Draft	UHC-specific PA submission + status
Availity API	Exp 47	Draft	Multi-payer PA submission gateway
FHIR PA APIs	Exp 48	Draft	Da Vinci CRD/DTR/PAS for 2027 payer APIs

Phase 2: Prediction Engine

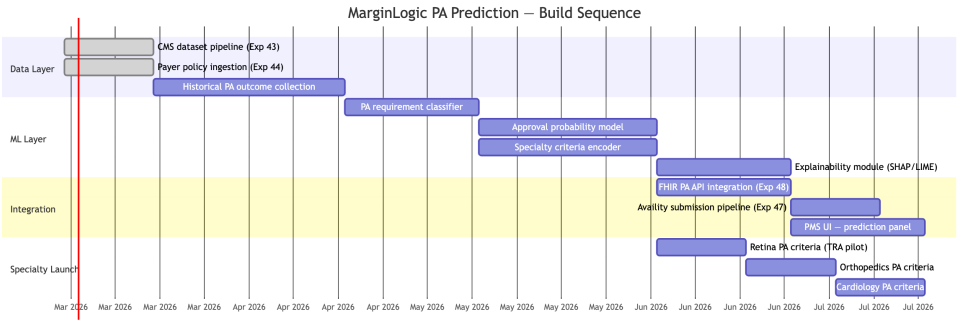

Diagram 9

Phase 3: AI Engine (On-Premise)

Component	Technology	Why
PA prediction model inference	**Qwen3.5-9B** (Exp 20, Small Series)	5 GB VRAM, GPQA 81.7 — runs on any clinic workstation; no PHI to cloud
Specialty criteria reasoning	**Qwen3.5-9B** thinking mode	Explainable reasoning chains for PA predictions; auditable
Document OCR + extraction	**Qwen3.5-9B**	OmniDocBench 87.7 — extract clinical evidence from scanned docs
Payer policy parsing	**Qwen3.5-4B** (Exp 20, Small Series)	Parse PDF payer policies into structured criteria; edge-deployable
Real-time PA check at point of care	**Qwen3.5-4B** via Ollama	Fast response during patient visit; 2.5 GB

---

8. Positioning Statement

> **MarginLogic** is the only PA intelligence engine built for specialty practices. While Abridge, Epic, Amazon, and Dragon compete to automate PA *submission* for hospitals, MarginLogic predicts PA *outcomes* — telling orthopedic surgeons, retina specialists, and oncologists exactly why a PA will be denied and what to fix before they submit. Every competitor's PA workflow ends with "submitted." MarginLogic's starts with "87% approval probability — add OCT to reach 95%."
